

KarmaFi

Turn attention into a market.

On-chain attention markets on BNB Chain — every viral post becomes a tradable token, and the people who create and spot it early finally own the upside.

Built on BNB Chain

THE PROBLEM

Attention is the internet's real currency — but the people who make it own none of it.

Creators get nothing tradable

A post can reach millions and the author walks away with karma points. The value accrues to the platform, not the person.

Early spotters aren't rewarded

The people with the taste to catch something before it goes viral have no way to back that conviction and share in the outcome.

Attention isn't ownable

Virality is locked inside walled gardens. It can't be priced, traded, or carried anywhere — so none of it compounds for the community.

THE SOLUTION

KarmaFi makes attention a market.

Any Reddit post can be launched as its own BEP-20 token, priced live on an on-chain bonding curve. Back content early and share in its rise — and a fixed share of every trade is reserved on-chain for the **original creator** to claim.

Price discovery from block one

A linear bonding curve means a market exists the moment a post is launched — no order book, no seeding, instant liquidity.

Creators are paid, on-chain

A reserved cut of all trading fees is held for the verified original author — aligning creators and the crowd, not pitting them against each other.

Winners graduate

When a market matures, its liquidity migrates to a PancakeSwap V2 pool with permanently burned LP — a real, community-owned token.

HOW IT WORKS

From a post to a permanent token — in four steps.

1

Launch

A curator turns a Reddit post into a market. The curator pays gas — no cost to the platform per launch.

2

Trade

The token trades on a bonding curve with a 1% fee. Price rises with demand, fully on-chain.

3

Claim

The original Reddit author verifies ownership and claims their reserved share of accrued fees.

4

Graduate

Past a reserve threshold, liquidity auto-migrates to PancakeSwap V2 and the LP is burned forever.

WHY NOW

Consumer crypto found its format — and BNB Chain is where it scales.

- **Bonding-curve launches are proven.** The token-launch model has shown there's enormous demand for instant, fair, no-presale markets — KarmaFi points it at real attention instead of empty memes.
- **SocialFi is the next on-ramp.** The next wave of users arrives through content and community, not trading screens.
- **BNB Chain fits consumer scale.** Low fees, fast finality, and the distribution to onboard mainstream users at the price point this needs.

Not a concept — it's shipped and trading.

The full stack is deployed on BNB Smart Chain mainnet, with audited and remediated smart contracts.

On-chain fee distribution

100% on-chain **Real trades, real reserves**

Every buy, sell, fee split and graduation settles on BNB Chain — verifiable on BscScan.

1% fee **Sustainable from day one**

A simple protocol fee on every trade, with a creator share reserved automatically.

LP burned **Trust by design**

Graduated liquidity is locked forever — no rug vector on matured markets.

Revenue scales directly with attention traded.

- **1% fee on every trade** across all markets — buys and sells alike.
- **Creator share reserved on-chain** to keep authors and curators bringing the best content.
- **Graduation deepens PancakeSwap liquidity**, extending each token's life and trading volume beyond the curve.

Why it compounds

More markets → more trades → more fees. Each graduated token becomes a standing, liquid asset that keeps generating volume, while the creator-reward loop pulls in the people who make content go viral in the first place. The flywheel is attention itself.

WHY KARMAFI WINS

A creator-aligned attention primitive — not just another launchpad.

Creators are paid, not extracted from

Reserving fees for the original author is a structural advantage: it turns the people with the audience into distribution instead of adversaries.

Real-world attention as the asset

Markets are anchored to actual posts and creators, giving every token a reason to exist beyond speculation.

Trust engineered in

Permanent burned liquidity on graduation and audited, remediated contracts directly attack the rug-pull reputation of the category.

Composable & expandable

An on-chain primitive that can extend to any social source — X, YouTube, and beyond — from the same engine.

ROADMAP

From live product to attention layer.

Now

Live & hardening

Mainnet trading, creator claims, and PancakeSwap graduation live. Focused on first markets and creator onboarding.

Next

More sources & tooling

Expand beyond Reddit to additional social sources, richer creator dashboards, analytics, and discovery.

Later

The attention layer

Mobile, deeper liquidity partnerships, and a path to community ownership of the protocol itself.

Make attention a liquid, fairly-distributed asset across every social network — where spotting something early is rewarded, and the creator always gets their cut.

LET'S BUILD

KarmaFi — the attention market for the internet.
